Problem statement: MineSweeper App
Write a program that simulates a Minesweeper game on a square grid.

- The game should begin by prompting the user for the grid size and the number of mines to be randomly placed on the grid.

- The program should then generate the grid and randomly place the specified number of mines on the grid.

- The user should then be prompted to select a square on the grid to uncover.
  - If the selected square contains a mine, the game is over and the user loses.
  - Otherwise, the selected square is uncovered and reveals a number indicating how many of its adjacent squares contain mines.
  - If an uncovered square has no adjacent mines, the program should automatically uncover all adjacent squares until it reaches squares that do have adjacent mines.

- The game is won when all non-mine squares have been uncovered.

- The program should display the game grid and allow the user to input their choices through a command line interface.

- Additionally, the program should track the user's progress throughout the game, displaying the minefield after each user input.

Game play

Sucess example
```
Welcome to Minesweeper!

Enter the size of the grid (e.g. 4 for a 4x4 grid):
4
Enter the number of mines to place on the grid (maximum is 35% of the total squares):
3

Here is your minefield:
  1 2 3 4
A _ _ _ _
B _ _ _ _
C _ _ _ _
D _ _ _ _

Select a square to reveal (e.g. A1): D4
This square contains 0 adjacent mines.

Here is your updated minefield:
  1 2 3 4
A _ _ 2 0
B _ _ 2 0
C _ 2 1 0
D _ 1 0 0

Select a square to reveal (e.g. A1): B1
This square contains 3 adjacent mines.

Here is your updated minefield:
  1 2 3 4
A _ _ 2 0
B 3 _ 2 0
C   2 1 0
```

#Requirements rewritten

1.Application is a minesweeper game.
2.Application should be able to be read user inputs.
3.The user will be freely able to input grid sizes and mines count
4.The application should generate a 2d mine field.
5.The user will be able to input a X and a Y dimension to specify a location on the field
6. The field will be filled with mines and numbers.
7. When the user selected a mine on the field, the game is lost
8. When the user selected all the grids, the game is won
9. When the user selected a '0' the surrounding 0 will be revealed + 1 in the border (Flood fill algo)?
10. Display the minefield after every selection.
11. Display only the revealed fields.
